Demand Estimation for Subscription Models

Identifying Willingness to Pay without Price Variation

Vineet Kumar

Yale University, USA

Yale Quant Marketing Seminar April 2023

- Subscription market is fast growing and potentially huge
 - Growth rate > 100% each year in the past 5 years
 - Multibillion revenue per year
 - Across a wide range of product categories (digital + physical)
 - Pay upfront and consume over time

Frontier Airlines Now Has an Unlimited Pass for Summer — Here's How to Score One

"For people with flexible schedules, this is a terrific opportunity to have a truly epic summer and then some, soaking up rays on the beach, exploring national parks and visiting new cities."

By Alison Fox | Updated on February 1, 2023

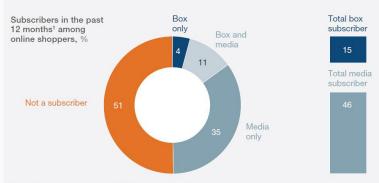

Subscription Services

Pay in advance with (un)limited usage

Industry	Product or Service	Price (\$)	Period	Total subscribers
Media & Entertain- ment	Netflix	9.99	Monthly	23 million (US)
	Spotify	9.99	Monthly	70 million (World)
	New York Times	3.75	Weekly	4 million (US)

	Jetblue "All You can Jet" Pass	699	Monthly	_

Subscription Services

Subscriptions are an increasingly common way to buy products and services online.

Note: Figures may not sum to 100%, because of rounding.

'Which of the following have you purchased or subscribed to in the past 12 months? % of those selecting online subscription-box service that delivers products regularly (eg, Blue Apron, Dollar Shave Club, Ipsy, Stitch Fix), subscription-based media (eg, ClassPass, Hulu, Netflix, Spotify), both, or neither.

Idea: Leverage high frequency usage data for identification.

Usage is captured at higher frequency than purchase.

► Main contribution: a novel method to identify & estimate semiparametrically the distribution of WTP given customer characteristics and product features when only usage variation is present, and exogenous shifters for leisure.

- ▶ Main contribution: a novel method to identify & estimate semiparametrically the distribution of WTP given customer characteristics and product features when only usage variation is present, and exogenous shifters for leisure.
- ► We also obtain the conditional WTP distribution (so, we can get WTP based on observables like gender / age / student etc.)

Research questions

Focus: Obtain WTP estimates for a subscription service with high frequency usage data

More specifically:

1. In absence of price variation, under what conditions on usage is it possible to identify distribution of WTP?

Focus: Obtain WTP estimates for a subscription service with high frequency usage data

More specifically:

- 1. In absence of price variation, under what conditions on usage is it possible to identify distribution of WTP?
- 2. What demand responses and profits to counterfactual product and pricing choices by the firm can be determined?

Focus: Obtain WTP estimates for a subscription service with high frequency usage data

More specifically:

- 1. In absence of price variation, under what conditions on usage is it possible to identify distribution of WTP?
- 2. What demand responses and profits to counterfactual product and pricing choices by the firm can be determined?
- 3. Is price variation the same as usage variation or is there additional value?

With Price Variation

Cross section data with price variation.

Notation

- i indicates a consumer
- Subscription decision: $S_i = 1$ (sub) and = 0 (not).
- ► WTP: W_i
- ightharpoonup Price: P_i

Decision rule:

$$\underbrace{W_i - P_i}_{\text{money-metric utility of service}} \text{vs} \qquad \underbrace{\mu = 0}_{\text{money-metric utility of of outside option}} \Rightarrow$$

$$S_i = \begin{cases} 1, & W_i > P_i \\ 0, & W_i \le P_i. \end{cases}$$

or $S_i = \mathbb{I}(W_i > P_i)$.

Parameter: prob WTP

▶ When
$$W_i \perp \!\!\! \perp P_i$$
, for any w in the support of P_i

 $Pr(W_i > w) = Pr(S_i = 1 | P_i = w).$

Data: Mkt shr in the 120p7

Model is based on microfoundations of usage based on leisure, and aggregated over time

► (High frequency): Consumer has a daily leisure budget, allocated between focal good and everything else

- ► (High frequency): Consumer has a daily leisure budget, allocated between focal good and everything else
- Exogenous shifters impact leisure budget

- ► (High frequency): Consumer has a daily leisure budget, allocated between focal good and everything else
- Exogenous shifters impact leisure budget
- ► Form expectations over the daily leisure process, conditional on observables

- ► (High frequency): Consumer has a daily leisure budget, allocated between focal good and everything else
- Exogenous shifters impact leisure budget
- Form expectations over the daily leisure process, conditional on observables
 - Rational expectations (or perfect foresight)

- ► (High frequency): Consumer has a daily leisure budget, allocated between focal good and everything else
- Exogenous shifters impact leisure budget
- Form expectations over the daily leisure process, conditional on observables
 - Rational expectations (or perfect foresight)
- ► (Low frequency): Consumer makes purchase (subscription) decisions every T periods at constant price P

Consider the consumer allocating leisure time:

► consumer leisure time spent in focal activity, e.g. listening to streaming music q_{it} ,

Consider the consumer allocating leisure time:

- ightharpoonup consumer leisure time spent in focal activity, e.g. listening to streaming music q_{it} ,
- ▶ Other "leisure" activities (e.g. playing outdoors) q_{0it} .

Consider the consumer allocating leisure time:

- ightharpoonup consumer leisure time spent in focal activity, e.g. listening to streaming music q_{it} ,
- ▶ Other "leisure" activities (e.g. playing outdoors) q_{0it} .
- ► Specify a money-metric utility function:

$$\max u_{it}(q_{it}, q_{0it})$$
 subject to $q_{it} + q_{0it} = \ell_{it}$

$$u_{it}(q_{it}, q_{0it}) = D_{it}u^{(1)}(q_{it}, q_{0it}; \theta_{im(t)}) + (1 - D_{it})u^{(0)}(q_{0it}; \theta_{im(t)})$$

Consider the consumer allocating leisure time:

- ightharpoonup consumer leisure time spent in focal activity, e.g. listening to streaming music q_{it} ,
- ▶ Other "leisure" activities (e.g. playing outdoors) q_{0it} .
- ► Specify a money-metric utility function:

$$\max u_{it}(q_{it},q_{0it})$$
 subject to $q_{it}+q_{0it}=\ell_{it}$

$$u_{it}(q_{it}, q_{0it}) = D_{it}u^{(1)}(q_{it}, q_{0it}; \theta_{im(t)}) + (1 - D_{it})u^{(0)}(q_{0it}; \theta_{im(t)})$$

 $ightharpoonup D_{it} \in \{0,1\}$ is an indicator for whether the focal activity is present or absent \implies rationalizes zero usage in many periods

We need to characterize usage at the daily level and relate to the monthly level WTP

▶ Daily leisure is modeled as depending on exogenous factors Z_{it} :

$$\ell_{it} = \mu_i + \gamma' Z_{it} + \varepsilon_{it},$$

We need to characterize usage at the daily level and relate to the monthly level WTP

$$Q_{it} = D_{it} r_{im(t)} \ell_{it},$$

- ► What class of utility functions are included?
 - Cobb-Douglas, CES, perfect substitutes, perfect complements, Leontief

Subscription Decisions

We know that WTP is: $W_{im} = \alpha_{im} L_{im}$

▶ account of consumer heterogeneity, both observed X_{im} and unobserved U_{im} . Consider a linear projection of $\ln \alpha_{im}$ onto X_{im} as:

$$\ln \alpha_{im} = \beta_0 + \beta_1' X_{1im} + U_{im},$$

where
$$\beta' = (\beta_0, \beta'_1)$$
 and $X'_{im} = (1, X'_{1im})$.

Subscription Decisions

We know that WTP is: $W_{im} = \alpha_{im} L_{im}$

▶ account of consumer heterogeneity, both observed X_{im} and unobserved U_{im} . Consider a linear projection of $\ln \alpha_{im}$ onto X_{im} as:

$$\ln \alpha_{im} = \beta_0 + \beta_1' X_{1im} + U_{im},$$

where $\beta' = (\beta_0, \beta_1')$ and $X'_{im} = (1, X'_{1im})$.

▶ Subscription choice $S_{im} = \mathbb{I}(\ln W_{im} > \ln P)$ becomes

$$S_{im} = \mathbb{I}(\ln L_{im} + \beta' X_{im} - \ln P + U_{im} > 0).$$

Endogeneity

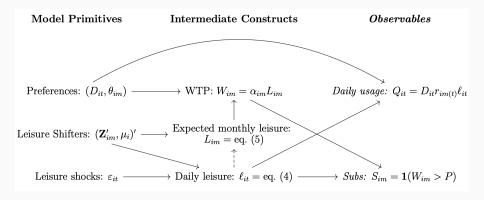

What exogenous variations are required for identification?

Assumption (Exogenous Variation in Leisure)

$$\mathbf{Z}_{im} \perp \mathcal{U}_{im} \mid (X_{im}, \mu_i),$$

Above implies $L_{im} \perp \!\!\! \perp U_{im} \mid (X_{im}, \mu_i)$ because the randomness of L_{im} only comes from \mathbf{Z}_{im} and μ_i .

Subscription Services

Theorem (Parametric Identification of WTP)

We have the following results when $U_{im} \mid (X_{im}, \mu_i) \sim \mathcal{N}(\sigma_{u,\mu}\mu_{im}^*, \sigma_u^2)$

- 1. The unknown parameters $(\beta, \sigma_u, \sigma_{u,\mu})$ are identified.
- 2. The distribution of WTP is identified, and

$$F_W(w|X_{im},\mu_i,L_{im}) = \Phi\left[\frac{1}{\sigma_u}\left(\ln w - \ln L_{im} - \beta'X_{im} - \sigma_{u,\mu}\mu_{im}^*\right)\right].$$

We do not need any parametric assumption like above.

What are the boundary conditions of this approach?

► What happens without usage data? Subscription equation

$$S_{im} = \mathbb{I}(\ln L_{im} - \ln P + \beta' X_{im} + U_{im} > 0)$$

= $\mathbb{I}[(\beta_0 - \ln P) + \beta'_1 X_{1im} + (\ln L_{im} + U_{im}) > 0]$

Cannot distinguish between L_{im} and U_{im}

What are the boundary conditions of this approach?

► What happens without usage data? Subscription equation

$$S_{im} = \mathbb{I}(\ln L_{im} - \ln P + \beta' X_{im} + U_{im} > 0)$$

= $\mathbb{I}[(\beta_0 - \ln P) + \beta'_1 X_{1im} + (\ln L_{im} + U_{im}) > 0]$

Cannot distinguish between L_{im} and U_{im}

▶ Without exogenous shifters Z_{it} , again this approach will not work

Estimation – Usage

▶ Leisure: $\ell_{it} = \mu_i + \gamma' Z_{it} + \varepsilon_{it}$ and Usage $Q_{it} = D_{it} r_{im(t)} \ell_{it}$

Estimation – Usage

- ▶ Leisure: $\ell_{it} = \mu_i + \gamma' Z_{it} + \varepsilon_{it}$ and Usage $Q_{it} = D_{it} r_{im(t)} \ell_{it}$
- ▶ Step 1: Estimate the usage model using finite mixture heterogeneity. Let $(\hat{\mu}_i, \hat{r}_{im}, \hat{\gamma}')$ be the estimates of (μ_i, r_{im}, γ')

Estimation – Usage

- ▶ Leisure: $\ell_{it} = \mu_i + \gamma' Z_{it} + \varepsilon_{it}$ and Usage $Q_{it} = D_{it} r_{im(t)} \ell_{it}$
- ▶ **Step 1:** Estimate the usage model using finite mixture heterogeneity. Let $(\hat{\mu}_i, \hat{r}_{im}, \hat{\gamma}')$ be the estimates of (μ_i, r_{im}, γ')
- ▶ Step 2: Estimate monthly expected leisure L_{im} by substituting the unknown parameters (μ_i, γ') with the estimates $(\hat{\mu}_i, \hat{\gamma}')$. Denote this estimator by \hat{L}_{im} .

Estimation - Subcription

WTP for the service: $W_{im} = \alpha_{im} L_{im}$

$$\ln \alpha_{im} = \beta_0 + \beta_1' X_{1im} + U_{im}$$

$$S_{im} = \mathbb{I}(\ln L_{im} + \beta' X_{im} - \ln P + U_{im} > 0)$$

▶ Step 3: For each month m, implement a linear regression of $\hat{\mu}_i$ on X_{im} and obtain the residuals $\hat{\mu}_{im}^*$. These residuals are the estimates of μ_{im}^* .

Estimation - Subcription

WTP for the service: $W_{im} = \alpha_{im} L_{im}$

$$\ln \alpha_{im} = \beta_0 + \beta_1' X_{1im} + U_{im}$$

$$S_{im} = \mathbb{I}(\ln L_{im} + \beta' X_{im} - \ln P + U_{im} > 0)$$

- ▶ **Step 3:** For each month m, implement a linear regression of $\hat{\mu}_i$ on X_{im} and obtain the residuals $\hat{\mu}_{im}^*$. These residuals are the estimates of μ_{im}^* .
- ▶ Step 4: Run the probit regression of S_{im} on $\ln(\hat{L}_{im}/P)$, X_{im} , and $\hat{\mu}_{im}^*$. The probit regression provides estimates of σ_u^{-1} , β/σ_u , $\sigma_{u,\mu}/\sigma_u$. Then the estimates of β and $\sigma_{u,\mu}$ are obtained easily.

► If we want to identify switching costs, no amount of usage variation is sufficient..

WTP variation with age / college status

Conclusions

Without Price variation, can we obtain WTP?

- ► A: Qualified Yes.
- What big data on usage tracking can tell us?
 - The distribution of WTP under some restrictions
- ► Can design counterfactual products and pricing strategies
- Cannot replace the role price variation, even limited, in identifying switching costs

Duration as a segmentation device

- ► Firms offer plans of different durations, e.g. Amazon offers Prime monthly and annual plans
- ▶ What's the distribution of the WTP for the shorter plan?
- ► One idea is to examine whether we can use duration effectively as a segmentation device
- ▶ When does it work well and when does it not?

► Identify interesting new mechanism based on plan duration

- ▶ Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP

- ▶ Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?

- ▶ Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?
 - Longer plans:

- Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?
 - Longer plans:
 - ► Can lock in consumers in the presence of switching costs, firms have to discount

- Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?
 - Longer plans:
 - Can lock in consumers in the presence of switching costs, firms have to discount
 - Pool over time periods and can help reduce across consumer heterogeneity

- Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?
 - Longer plans:
 - Can lock in consumers in the presence of switching costs, firms have to discount
 - Pool over time periods and can help reduce across consumer heterogeneity
 - ► Firm is deciding between 1 month plan and 2 month plans

- ▶ Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?
 - Longer plans:
 - Can lock in consumers in the presence of switching costs, firms have to discount
 - Pool over time periods and can help reduce across consumer heterogeneity
 - Firm is deciding between 1 month plan and 2 month plans
 - ► Consumer A has high utility v_H in month 1 and low utility v_L in month 2, so is HL type

- Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?
 - Longer plans:
 - Can lock in consumers in the presence of switching costs, firms have to discount
 - Pool over time periods and can help reduce across consumer heterogeneity
 - ► Firm is deciding between 1 month plan and 2 month plans
 - Consumer A has high utility v_H in month 1 and low utility v_L in month 2, so is HL type
 - ▶ If we offer a 2 month plan, then both consumers should have WTP: $(v_L + v_H)$

- Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP
 - ► WTP for Prime might be higher during holiday season, maybe I just buy then?
 - Longer plans:
 - Can lock in consumers in the presence of switching costs, firms have to discount
 - Pool over time periods and can help reduce across consumer heterogeneity
 - ► Firm is deciding between 1 month plan and 2 month plans
 - Consumer A has high utility v_H in month 1 and low utility v_L in month 2, so is HL type
 - ▶ If we offer a 2 month plan, then both consumers should have WTP: $(v_L + v_H)$
 - ► Makes it easier to extract surplus

- ▶ Identify interesting new mechanism based on plan duration
 - Shorter plans allow flexibility and could increase consumer WTP

 - Longer plans:
 - ► Can lock in consumers in the presence of switching costs, firms have to discount
 - Pool over time periods and can help reduce across consumer heterogeneity
 - ► Firm is deciding between 1 month plan and 2 month plans
 - Consumer A has high utility v_H in month 1 and low utility v_L in month 2, so is HL type
 - ► If we offer a 2 month plan, then both consumers should have WTP: $(v_I + v_H)$
 - ► Makes it easier to extract surplus
 - Duration can be a strategic design decision so the firm $_{35/37}$

A bigger picture (of a fridge)

Essentially, we need the separation of purchase (subscription) and consumption (usage).

A bigger picture (of a fridge)

- ► Essentially, we need the separation of purchase (subscription) and consumption (usage).
- Such separation also holds in packaged goods (beer)—but we did not track the usage.
- ▶ 5G and Internet of Things could enable such tracking.

My Research Overview
